Presented By: Eric J. Marshall

When I started in the industry, my boss drew me a picture of what WE DID.

I Upgraded the Drawing

1. Address Cable

2. Address Pathway

3. Address the Stations

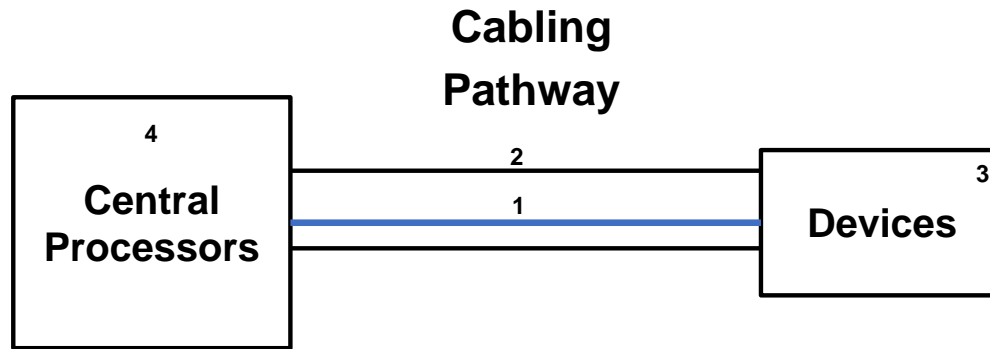

4. Address the Head End

Completed Picture

What Do We Do TODAY?

Audio Video

Who are you?

- A. Engineer/Designer**
- B. Sales Agent**
- C. Installer**
- D. Project Manager**
- E. Commission Agent / Inspector**
- F. Programmer**
- G. ALL THE ABOVE!**

Can we do AV?

I was hired to start doing AV at a structured cabling company`

Do you know how to
install cable?

Do you know how to
mount things on walls
and ceilings?

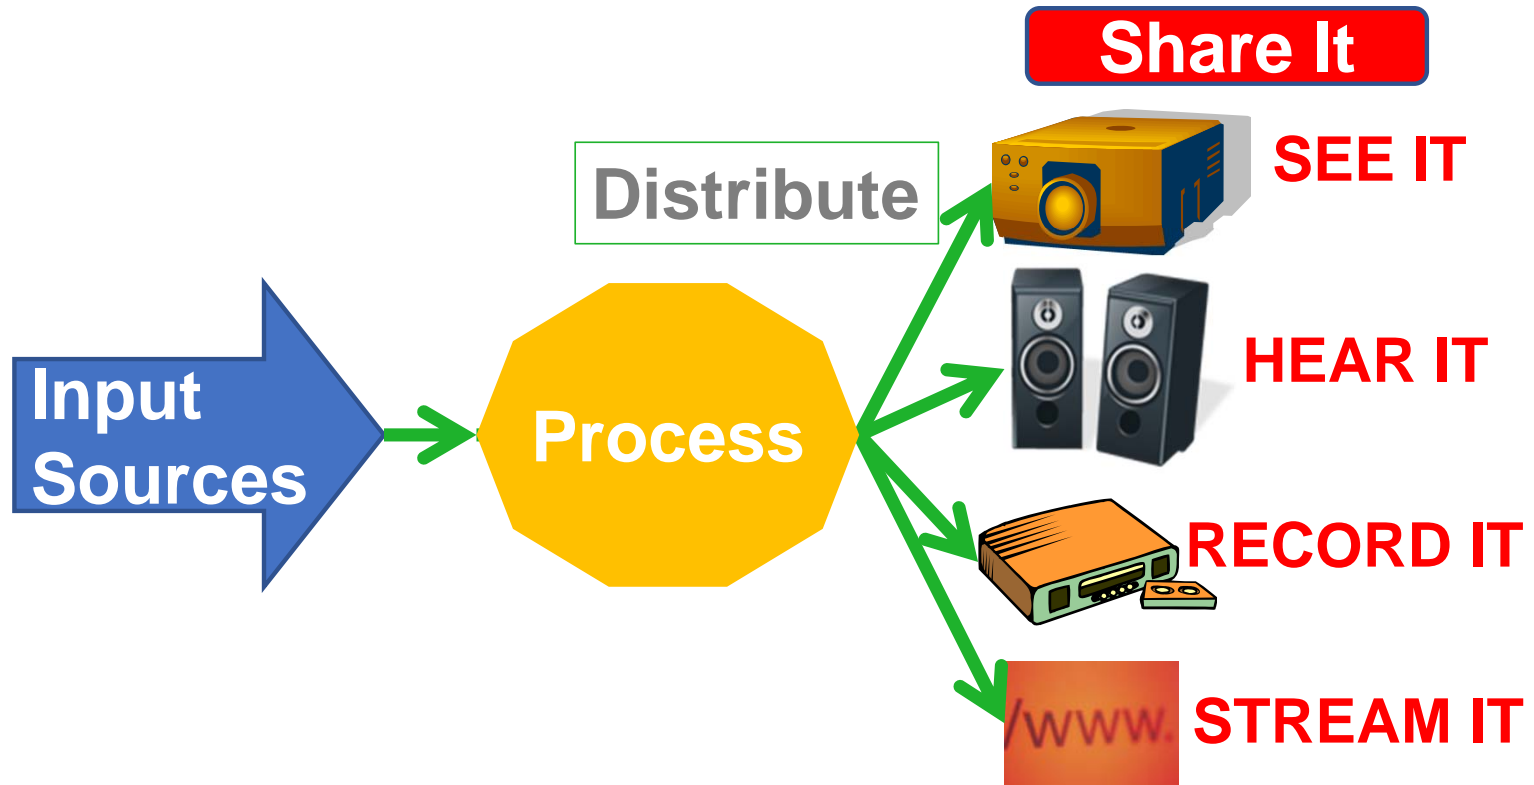

Let me pull your cable! We are both going to the same place!

TDMM:
Save 30-40%

Sold 2.4 million
In 2 months!

4 Steps of AV

5th Step of AV

- 
1. Input Sources
 2. Share It
 3. Distribute
 4. Process
 5. Control

Which are the 5 Steps of AV?

A.

Select Sources – Share It – Cable It – Process – Control

B.

Input Sources – Share It – Distribute – Process – Control

C.

Pick Sources – Pick Outputs – Cable It – Share It – Control It

4 Steps of AV

5th Step of AV

Step 1 – Input Sources

What are input sources?

Anything that generates Audio or Video

Audio Source Examples

- CD Player / Recorder
- DJ Mixer / Karaoke
- MP3 Player or iPod
- Streaming – Spotify, Pandora...
- Audio Server
- AM/FM Tuner
- Satellite Radio
- Cassette Tape Player / Recorder
- Phonograph / Record Player / Turntable
- Microphone
- Instrument
- Public address / Noise Masking
- Bluetooth from Phone

Video Source Examples

- BluRay Player / Recorder
- TV Box or TV antenna
- Digital Signage
- VCR
- DVR / Video Server
- I-Pod Video / Phone
- Camera
- Computer
- Video CDs
- Document Camera
- Game Console
- Web Conference
- Streaming Service
- BYOD Wireless Collab Device
- Microscope / Telescope

You don't have to worry about all the sources

CONNECTORS
CONNECT

High Resolution

- RGBHV = 5 Wire
- RGSB = 4 Wire
- RGSB/RsGsBs = 3 Wire

Can be either

- Component = 3 Wire

Low Resolution

- S-video (Y/C) = 2 Wire
- Composite = 1 Wire
- Radio Frequency (RF)

BNC Connector

- Used with coaxial cable.
- It is a round metal connector that is pressed and twisted to lock into place.
- BNC stands for “Bayonet Neill Concelman” (the names of the two developers – Paul Neill and Carl Concelman).
- Used for professional AV applications.

DB / HD Connectors

- Common connector for computers.
- If it has 2 rows of pins it is called a “D-sub” or “DB” connector.
- If it has 3 rows of pins it is called an “HD” connector.
- The connector type is usually followed by a number telling the number of pins it can hold.
(ex. DB9, DB25)
- **HD15 is what is used by most computers!**

HD15 VGA Plug

DB9 Serial Plug

Audio plug

- Plugs are used for many audio applications
- Typical sizes are 3.5mm, 2.5mm, 1/4", and 3/16"
- **3.5mm** is what is used on most computers and portable audio devices!

Audio Connectors

What Does Digital Add to Signal?

EDID

(Extended Display Identification Data)

- Hot Sync

- AV properties

- HDCP

The screenshot shows the 'Monitor Asset Manager' application window. It has a menu bar with 'File', 'Edit', 'View', and 'Help'. The main area is divided into three panes: 'Display IDs', 'Raw Data', and 'Asset Information'. The 'Display IDs' pane shows a list of display IDs, with 'SEC4B41 [Registry-Active]' selected. The 'Raw Data' pane shows a hex dump of the EDID data. The 'Asset Information' pane shows the following details:

Property	Value
Monitor	Generic PnP Monitor
Windows description	Generic PnP Monitor
Manufacturer	Samsung
Plug and Play ID	SEC4B41
Serial number	n/a
Manufacture date	2009, ISO week 0
Filter driver	Monitor
EDID revision	1.4
Input signal type	Digital
Color bit depth	Undefined
Color encoding formats	RGB 4:4:4, YCrCb 4:4:4
Screen size	260 x 160 mm (12,0 in)
Power management	Not supported
Extension blocs	None
DDC/CI	n/a
Color characteristics	
Default color space	Non-sRGB
Display gamma	2,20
Red chromaticity	Rx 0,580 - Ry 0,340
Green chromaticity	Gx 0,310 - Gy 0,550
Blue chromaticity	Bx 0,155 - By 0,155
White point (default)	Wx 0,313 - Wy 0,329
Additional descriptors	None
Timing characteristics	

What Does Digital Add to Signal?

Prevent Non-licensed devices from receiving content
Block eavesdropping – “Man in the Middle” attacks

- Toslink

THE REAL
CONNECTION
IS THE
SIGNAL

CONNECTORS
CONNECT

BUT

The Physical Connection

- Consists of two major components:
 - Conductors= pieces of wire that carry signals between devices. \$\$\$\$\$\$
 - Connectors= mechanical junctions between the conductors and pieces of equipment.
- To properly understand how to connect devices to the AV system you need to understand **CONNECTORS and SIGNALS.**

What's the difference on the connector?

- The Pin Out – the way the conductors are placed in the connectors on each end. The pin out is the “Road Map” for the signal!

- DB9 used for RS232
 - Pin 2 & Pin 3 = TX and RX
 - (go two more) Pin 5 = Ground

HD15 VGA Plug

DB9 Serial Plug

What's the difference on the connector?

What are the Pin-outs?

- Computer = HD 15
- S-video = 4 pin din
- Consumer Audio plug = 3.5mm
- Instrument/Professional Audio plug = 1/4"
- RCA Color codes
 - Yellow, Green & Blue & Red = video
 - White, Red, Black, Orange= audio
- What version digital cable?

THE REAL
CONNECTION
IS THE
SIGNAL

CONNECTORS
CONNECT

BUT

Male vs Female Connectors

Male connectors typically send and female receive.

What else makes the difference?

- Cables are a channel for the signal – WHAT GOES IN COMES OUT!!!!
- **Cables/Adapters can not change the signal – electronics or special circuitry within a cable can.**
- Examples:
 - DVI signal from a computer is different from DVI signal from a TV.
 - VGA (computer) and component video are different signals.

Gender Changers & Adapters

Change pathway at other end?
Useful for coupling

Make sure signal is same!
Make sure pin out is same!

AES/EBU vs. S/PDIF

BUT

THE REAL
CONNECTION
IS THE
SIGNAL

CONNECTORS
CONNECT

Which is Correct?

- A.
Connectors connect, but the real connection is the signal
- B.
You can only connect devices with the same connectors
- C.
You can use an adapter anytime to connect devices
- D.
You can use any type of HDMI cable

What is in the signal?

VIDEO

- Resolution
- Signal Type – RGB, Component...
 - Digital Add Ons

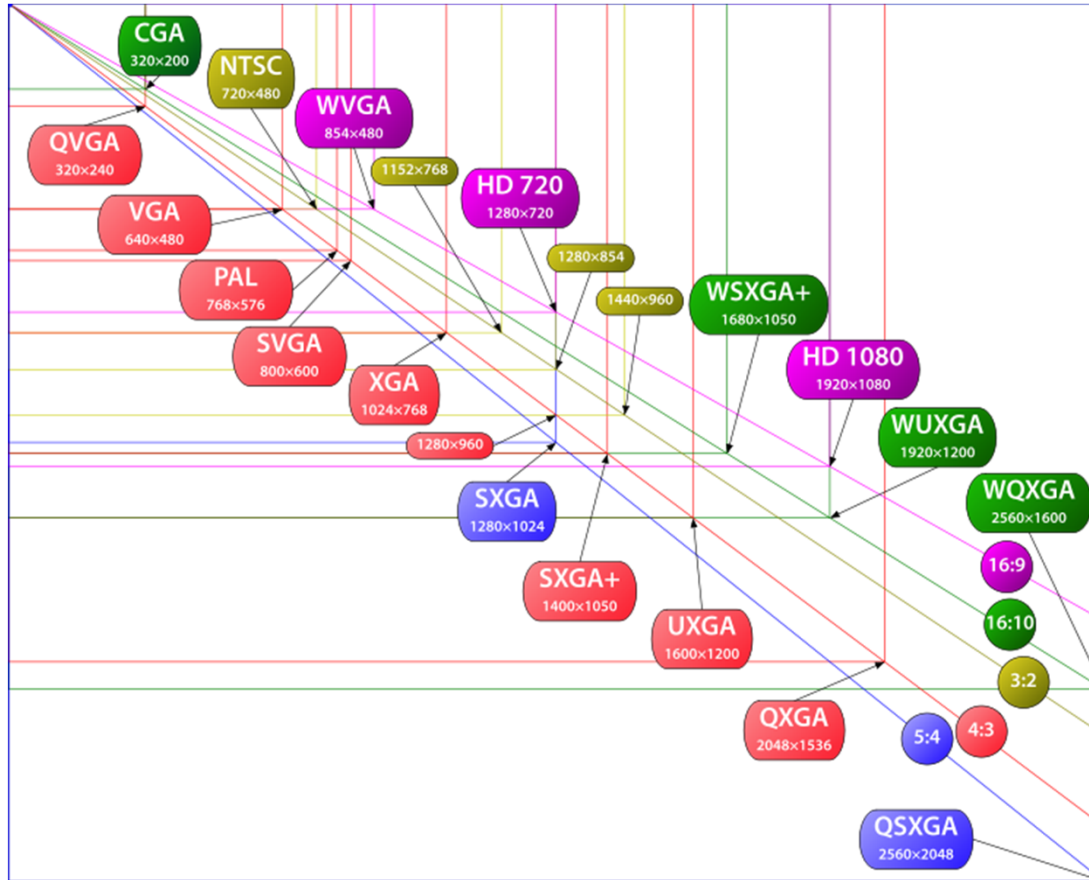

What is Resolution?

- Resolution = a measure of a video device's capability to make small dots and lines on a screen.
- Horizontal resolution = number of dots that can fill one line
- Vertical resolution = Number of lines.
- NTSC standard = 480 lines
- HDTV = 720 and 1080 lines
- UHD = 2K, 4K, 8K

Example Resolutions

640 x 480 VGA
800 x 600 SVGA
1024 x 768 XGA
1600 x 1200 UXGA
1920 x 1080 Full HD

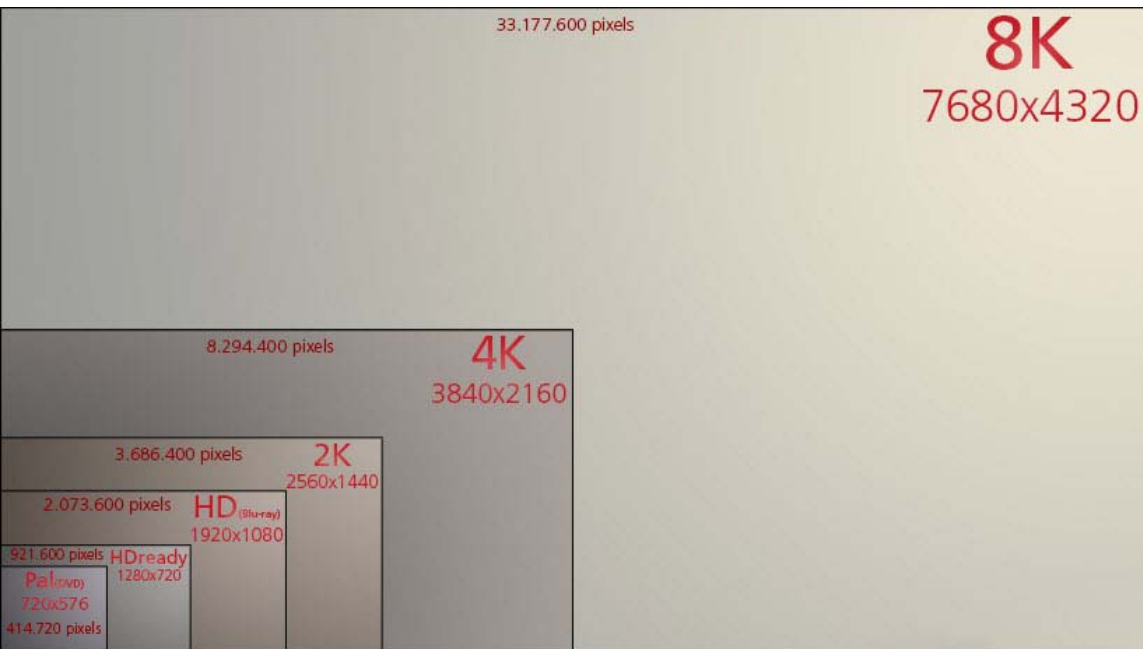

What is High Definition?

- High Definition is wider and fills more of the eyes viewing area.
- High Definition has more pixels.
- High Definition can be both digital and analog.

This video was captured in 8K

What is with the “i” and “p”?

1/60th of a second field

+

1/60th of a second field

Progressive Scan

Interlaced Video

30Hz vs 60Hz

What is Signal Type?

Output Configuration

Video Audio

	Output	Format	Color Bit Depth	HDCP Mode	HDCP Compliance	Video Mute
1	Output 1	Auto	Auto	Auto	No Display	Mute
2	Output 2	Auto	Auto	Auto	No Display	Mute
3	Output 3	Auto	Auto	Auto	No Display	Mute
4	Output 4	Auto	Auto	Auto	No Display	Mute
5A	Output 5	Auto	Auto	Auto	No Display	Mute
5B	Output 5	Auto	Auto	Auto	No Display	Mute
6A	Output 6	Auto	Auto	Auto	No Display	Mute
6B	Output 6	Auto	Auto	Auto	No Display	Mute
7	Output 7	Auto	Auto	Auto	No Display	Mute
8	Output 8	Auto	Auto	Auto	No Display	Mute

The screenshot shows a software interface for configuring video outputs. A dropdown menu is open for the 'Format' column of the first row, displaying the following options: Auto, DVI RGB 444, HDMI RGB 444 Full, HDMI RGB 444 Limited, HDMI YUV 444 Full, HDMI YUV 444 Limited, HDMI YUV 422 Full, and HDMI YUV 422 Limited. The 'Auto' option is currently selected.

Digital Add Ons?

The screenshot shows a software interface for configuring video inputs. At the top, there are navigation icons for EDID Minder, Input Config (selected), Output Config, Scaler Settings, Ties and Presets, and General Settings. Below the navigation is the 'Input Configuration' section, which has tabs for 'Video' and 'Audio'. The main area contains a table with 10 rows, each representing an input channel. Each row has columns for 'Input' (a text box), 'Signal Presence' (a radio button), 'Signal Type' (text), 'HDCP Authorized' (a checked checkbox), and 'HDCP Encryption' (text).

	Input	Signal Presence	Signal Type	HDCP Authorized	HDCP Encryption
1	Input 1	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
2	Input 2	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
3	Input 3	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
4	Input 4	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
5	Input 5	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
6	Input 6	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
7	Input 7	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
8	Input 8	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
9	Input 9	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal
10	Input 10	<input type="radio"/>	No signal detected	<input checked="" type="checkbox"/>	No Signal

Which is NOT a component of a Video Signal?

- A.
HDCP encryption
- B.
Audio and control
- C.
Resolution, frames/refresh rate, and color
- D.
The cable connector

What About Audio?

Pre-Process

- Mic = -60 dBV (0.001 volt) to -40 dBV (0.010 volt)
- Instrument = -20dBu
- Pro Line = +4dBu (1.25V)
- Consumer Line "Aux" = -10 dBV (0.300 volt)

After Process

- Speaker = 25v or 70v or 4/8ohm

Electrical dB reference chart:

Reference Symbol:	Reference type:	Reference level:	Comments:
dBm	power	0 dBm = 1.0 mW	Original electrical dB reference
dBV	pressure	0 dBV = 1.0 V RMS = +2.2 dBu	Rarely used in pro audio
dBv	pressure	0 dBv = 0.7746 V RMS	Older version of dBu, rarely used
dBu	pressure	0 dBu = 0.775 V RMS	Frequently used in pro audio
dB VU	pressure	0 dB VU ~ +4 dBu	Pseudo-reference for VU meters & LED bar graphs

Meters

Scales compared

Volts	dBu	VU	dBfs (SMPTE RP155)
12.283V	24 dBu		0 dBfs
9.757V	22 dBu		-2 dBfs
7.750V	20 dBu		-4 dBfs
6.156V	18 dBu		-6 dBfs
4.890V	16 dBu		-8 dBfs
3.884V	14 dBu		-10 dBfs
3.085V	12 dBu		-12 dBfs
2.451V	10 dBu		-14 dBfs
1.947V	8 dBu		-16 dBfs

What About Audio?

Mono vs Stereo

- Mono - One single Channel of Audio
- Stereo - Two Channels of audio (Left and Right)

Figure 5. 6-pole Audio Input Wiring

Figure 7. 6-pole Audio Output Wiring

What About Audio?

Mono vs Stereo

When mixing stereo to mono, attenuate both channels by -6dB to the output bus and the sum will be at the same 0 dB as both input channels

What About Audio?

Frequency, Loudness, and Timing

1-35 ms

Which is NOT a component of an Audio Signal?

- A.
Voltage / Level
- B.
Balanced vs Unbalanced
- C.
The cable connector
- D.
Frequency and timing

Microphones for Applications

- Handheld
- Shotgun - Theatre
- Parabolic – Sporting events
- Lavalier – Attach to clothing
- Contact pickup – Musical instruments
- Pressure response – Lay on flat surface
- Boundary – Set on Table for meeting
- Ceiling – Theater or Conference Room

- Two common types of microphones are...

- Dynamic Microphones

- Condenser Microphones

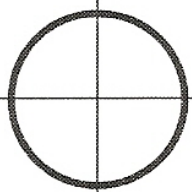

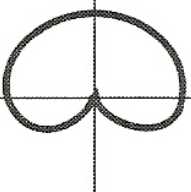

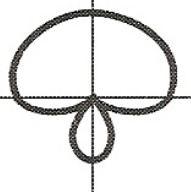

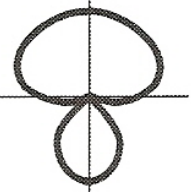

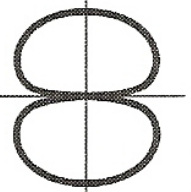

(Requires phantom power)

Phantom
Power

Microphone Pick Up Patterns

Characteristic	Omni - directional	Cardioid	Super - cardioid	Hyper - cardioid	Bi - directional
Polar response pattern					
Coverage angle	360°	131°	115°	105°	90°
Angle of maximum rejection (null angle)	—	180°	126°	110°	90°

Microphone Pick Up Patterns

Antenna Distribution

How many channels?

Depends on Frequency!

More money is typically better (features)

- VHF
- UHF
- UWB
Ultra Wide Band
- Ethernet

Note: Pay attention to “Frequency” with THE MIC also!

Which is NOT a concern with microphones?

- A. The cable connector
- B. Pick Pattern
- C. Application and power requirements
- D. Frequency, channels, and antennas

Give the User an Input

- Traditional
 - Skill Required
- Plug and Play
 - Not Hard Lid
 - Limited Futureability
- Twisted Pair
 - Solid conductor plugs
 - 2 cables? = 1 UTP/1 STP
 - Pay attention to A vs. B
 - Cat5E better for analog (Skew Free/Low Skew)
 - IF sending video – USE SHIELDED Cat6 or better
 - IP video follows same rules as our data cabling

QLED TV

QLED (Samsung Q7F)

QLED PROS AND CONS

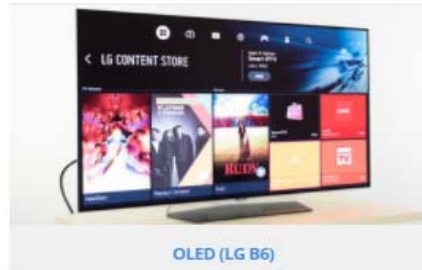

Pros:

Brilliant whites
Ultra-bright (1,500nits)
Variety of screen sizes between 49-88-inch

Cons:

Not as slim (25.4mm)
Overly bright
Less convincing blacks
Slower refresh rate

OLED TV

OLED (LG B6)

OLED PROS AND CONS

Pros:

Lighter and thinner (2.57mm)
Self-lighting pixels
More convincing blacks
Faster refresh rate (0.001ms)
Judder and blur-free

Cons:

Only found in three screen sizes: 55, 65 & 77-inch
Muted brightness (1,000nits)
Expensive

LED TV

LED (Samsung KS8000)

	QLED	OLED	LED
Black Level	Good	Perfect	Good
Motion Blur	Great	Perfect	Good
Viewing Angle	Poor	Great	Poor
Color volume	Great	Good	Good
Gray Uniformity	Average	Good	Average
Luminosity	Good	Good	Great
Image Retention	Great	Poor	Great
Price and Availability	Poor	Average	Great

Projector Mounting Examples

Measure twice...
Pay attention to alignment and height
Beware of building vibration

Monitor Display Mounting Examples

Pitch, Roll, & Yaw

A Word About Digital Signage

- Commercial TVs – made to run brighter longer (16/7 & 24/7)
- Built in Software or External Box

A Word About Video Walls

- Thin bezel vs video wall

- Built in video wall capability drawbacks

- Can mount vertically or horizontally or architecturally (Remember aspects!)

Which is NOT a concern with projectors or displays?

- A. Light source and native resolution
- B. Size for height and distance and type of mount
- C. Warranty and connections/features
- D. Different manufacturer specs to compare brightness

Pendant Speakers

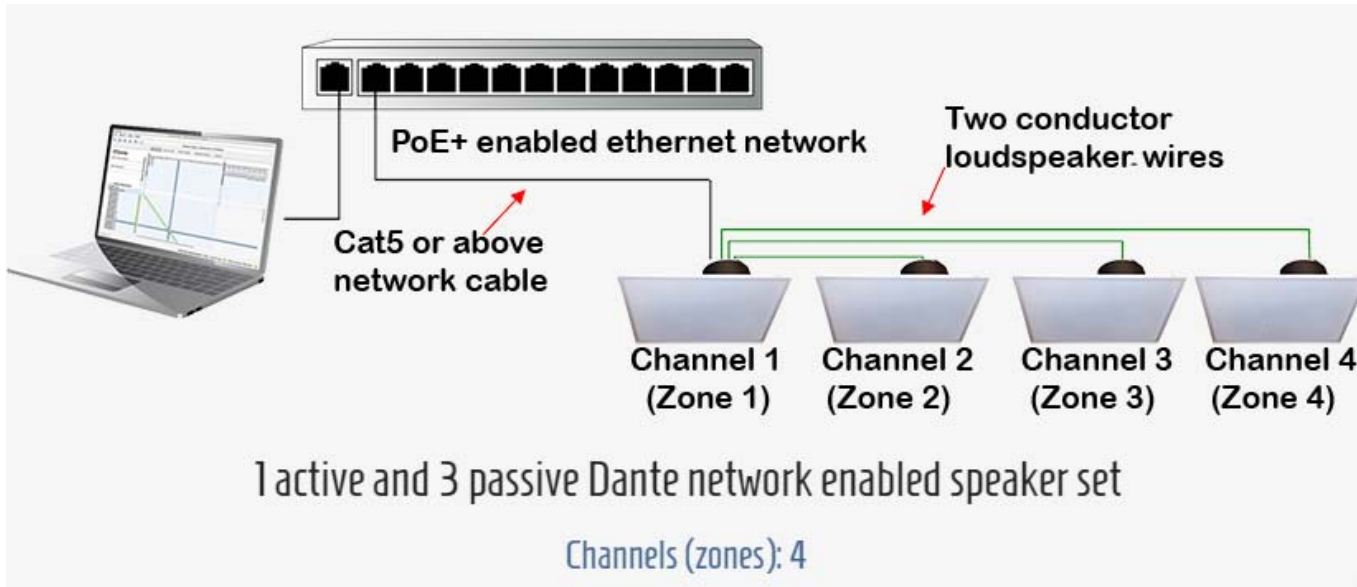

Hidden Speakers

Architectural Options for Aesthetics

Constant Voltage vs 4/8 ohm direct

CV can go longer and do more speakers. Direct can go louder and can sound better.
CV speaker is actually an 4/8ohm speaker!

Dante Speakers

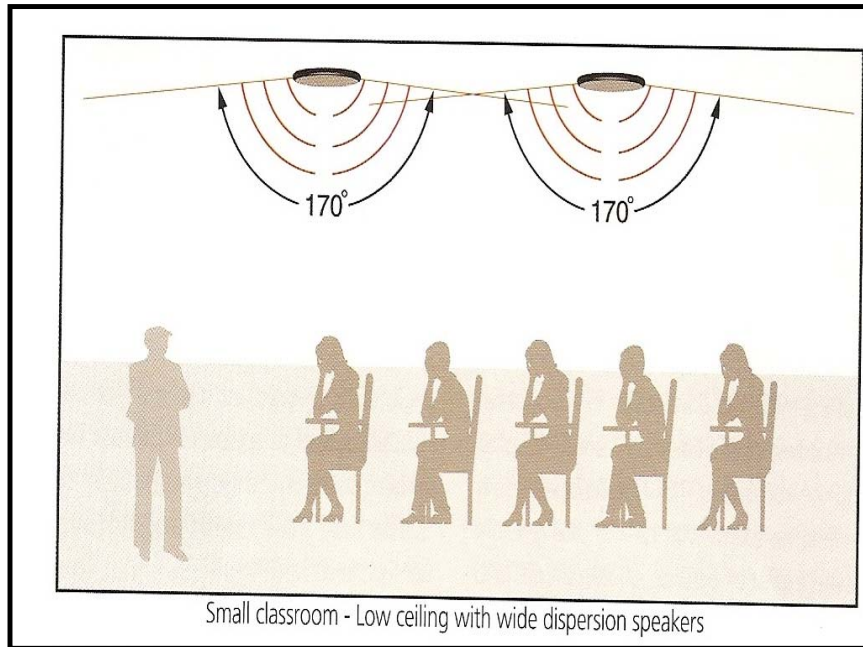

Powered Speakers

- Speakers frequency ranges...
 - **Tweeters**-High freq.
(2,000-20,000 Hz)
 - **Horns**-Mid.-High freq.
(300-8,000 Hz)
 - **Midrange cones**-Mid. freq.
(200-8,000 Hz)
 - **Woofers**-Low freq.
(40-600 Hz)
 - **Subwoofers**-Lower freq.
(20-200 Hz)

If crossover is not built in will have more than one termination block and need processing to filter frequencies.

Speaker dispersion

Small classroom - Low ceiling with wide dispersion speakers

Lecture hall - High ceiling with high power medium dispersion speakers

Work with architect to determine ceiling height for speakers and adequate screen height!

Speaker dispersion

Speaker Placement

- *Turning volume up does not increase coverage area only loudness*
- Ceiling Speakers
 - Determine # of speakers using ceiling height X2 rule
- Wall Baffles
 - Determine # based on height from floor to speaker
 - 8' high = space 20' apart
 - 16' high = space 30' apart
 - Stagger on opposing walls

Know the requirements for ADA and your region

California:

11B-219.2 Required systems = An assistive listening system shall be provided in assembly areas, including conference and meeting rooms.

The minimum number of receivers to be provided shall be equal to 4 percent of the total number of seats, but in no case less than two...25% hearing aid compatible...building seats determine actual #...

Which is NOT a concern with audio outputs in our system?

- A. Architectural Aesthetics and Application
- B. Speaker dispersion patterns and placement
- C. People with hearing loss and frequencies
- D. What the audio source is

Video over Ethernet

Over Ethernet – Switch Recommendations

Dante Recommended Network Switch Features

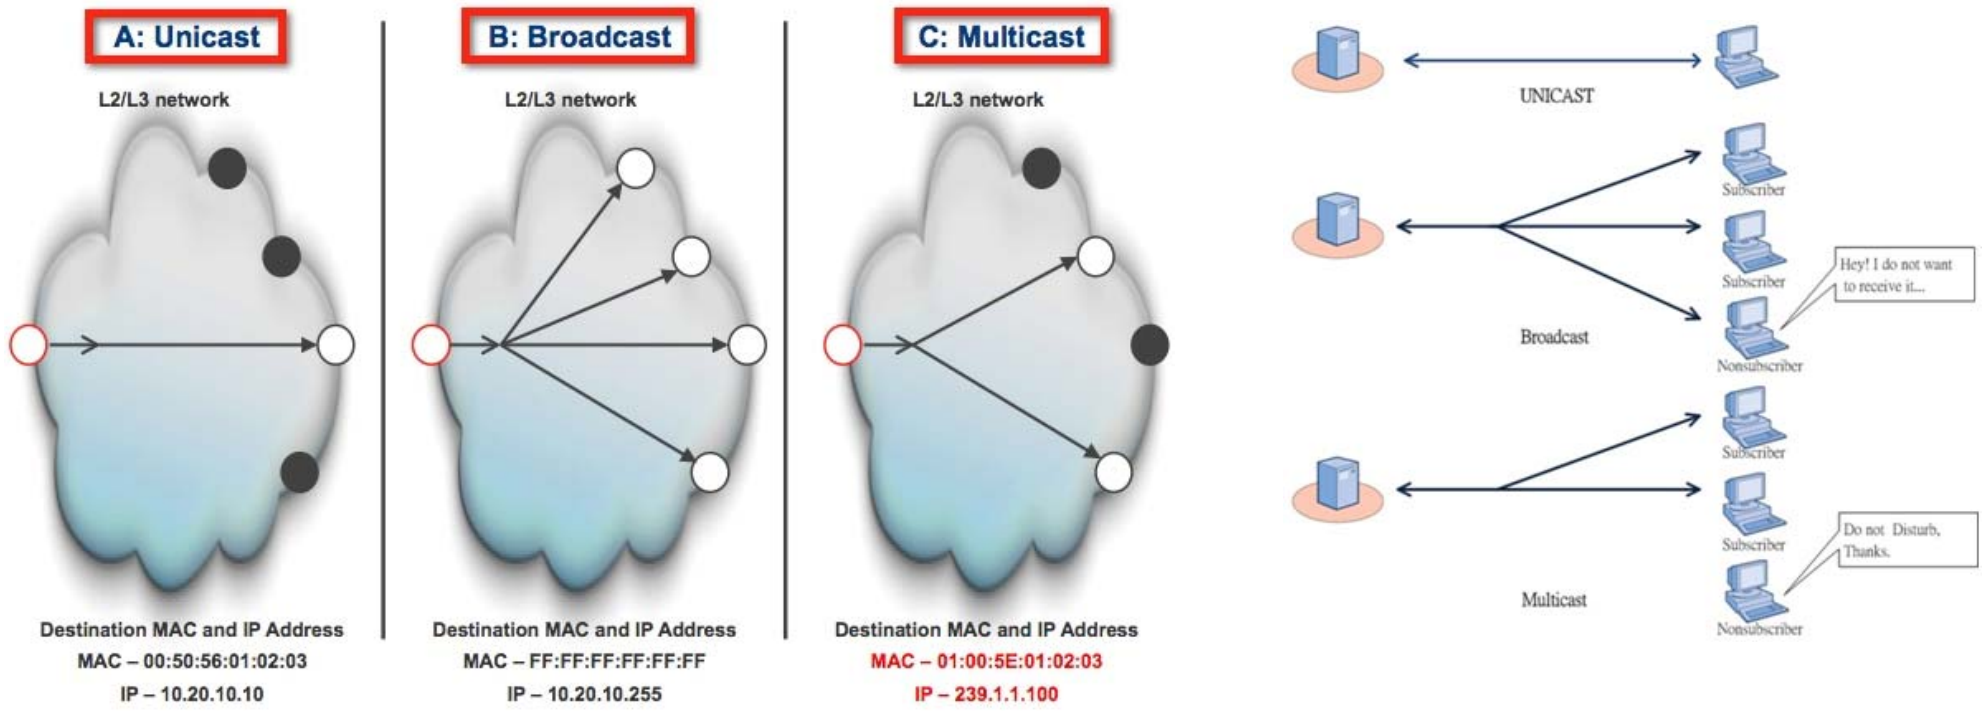

- No EEE or Green Ethernet features enabled 
- Gigabit switches
- Unmanaged Switches
 - Single network switch applications
 - Dedicated Dante traffic
- Managed Switches
 - Multiple network switch applications
 - Mixed traffic

EDSP – Dante Network Connectivity

Over Ethernet – Switch Recommendations

Over Ethernet – Switch Recommendations

You want a managed switch!

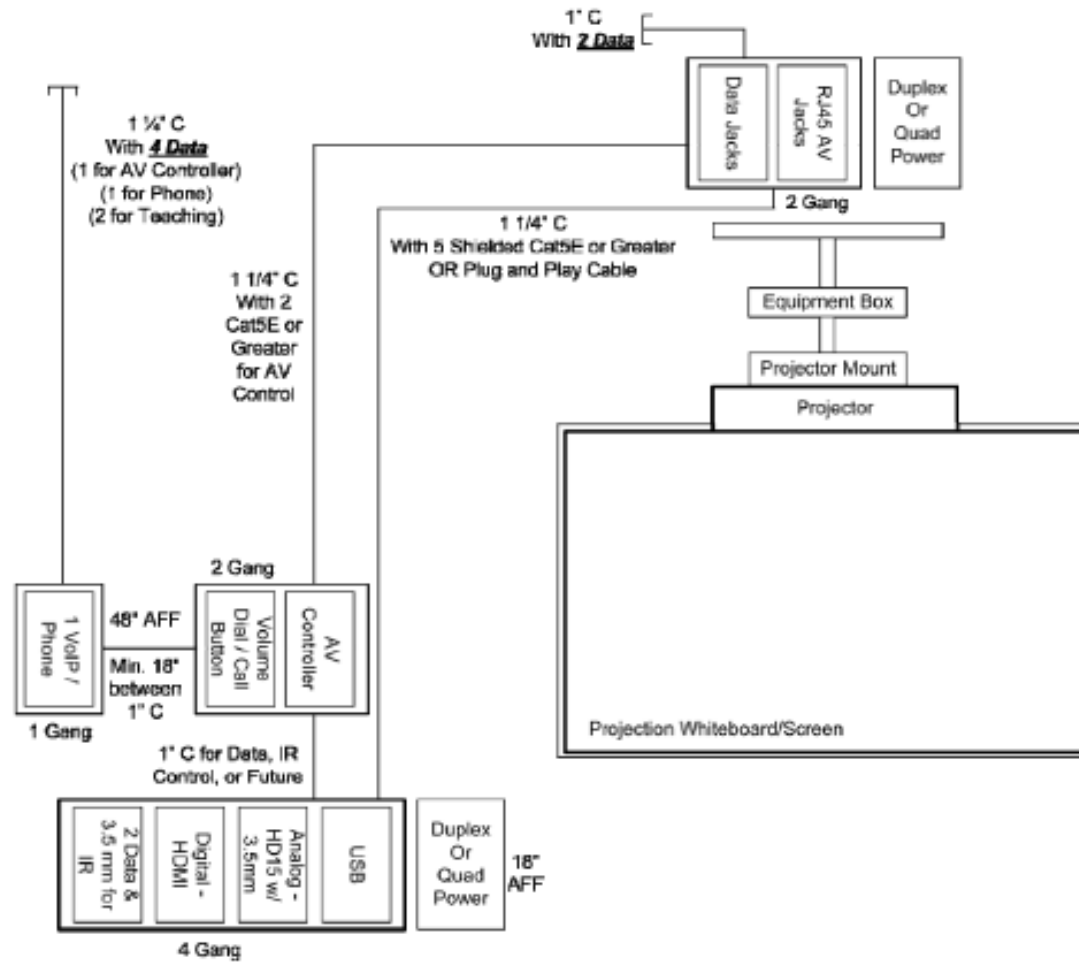

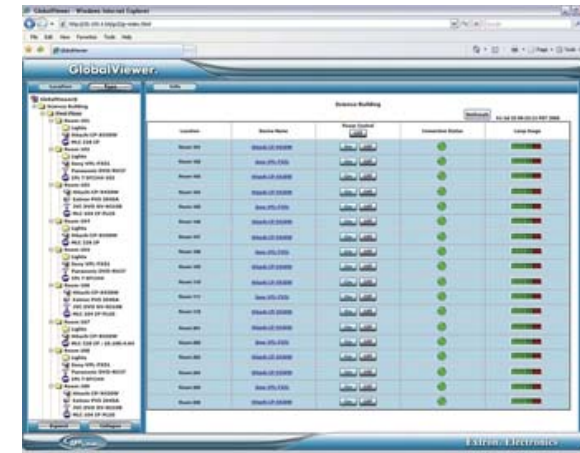

Figure 7-3
Minimum Recommended AV Infrastructure

Make sure to have data connections:

- At input locations
- At displays
- At processing and control equipment

Which is NOT a concern when it comes to distribution in our system?

A.

Type of cable

B.

What is the latest technology craze

C.

Where inputs & outputs are located & data and power near

D.

Size of conduits and outlet boxes and paths between

Step 4 – Process

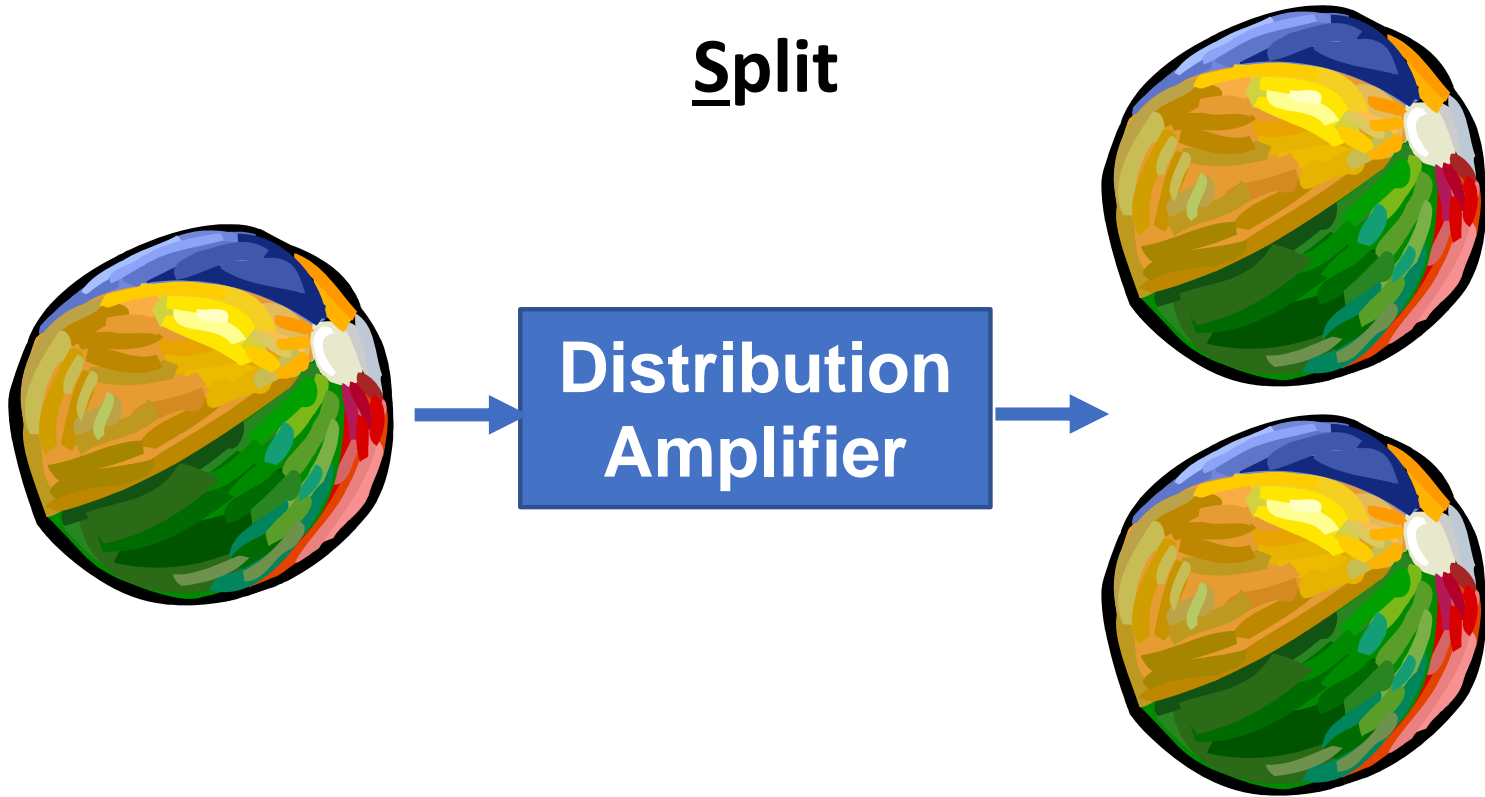

4 Steps of AV

STEP 4 - Process

- Can be separate pieces of equipment or built into equipment used in step 2
 - Best to use separate
- Can be separate pieces of equipment for each option or one box can do several processing options
 - Save money and space with a box that does many features

Split

Supe Up (Strengthen)

Switch

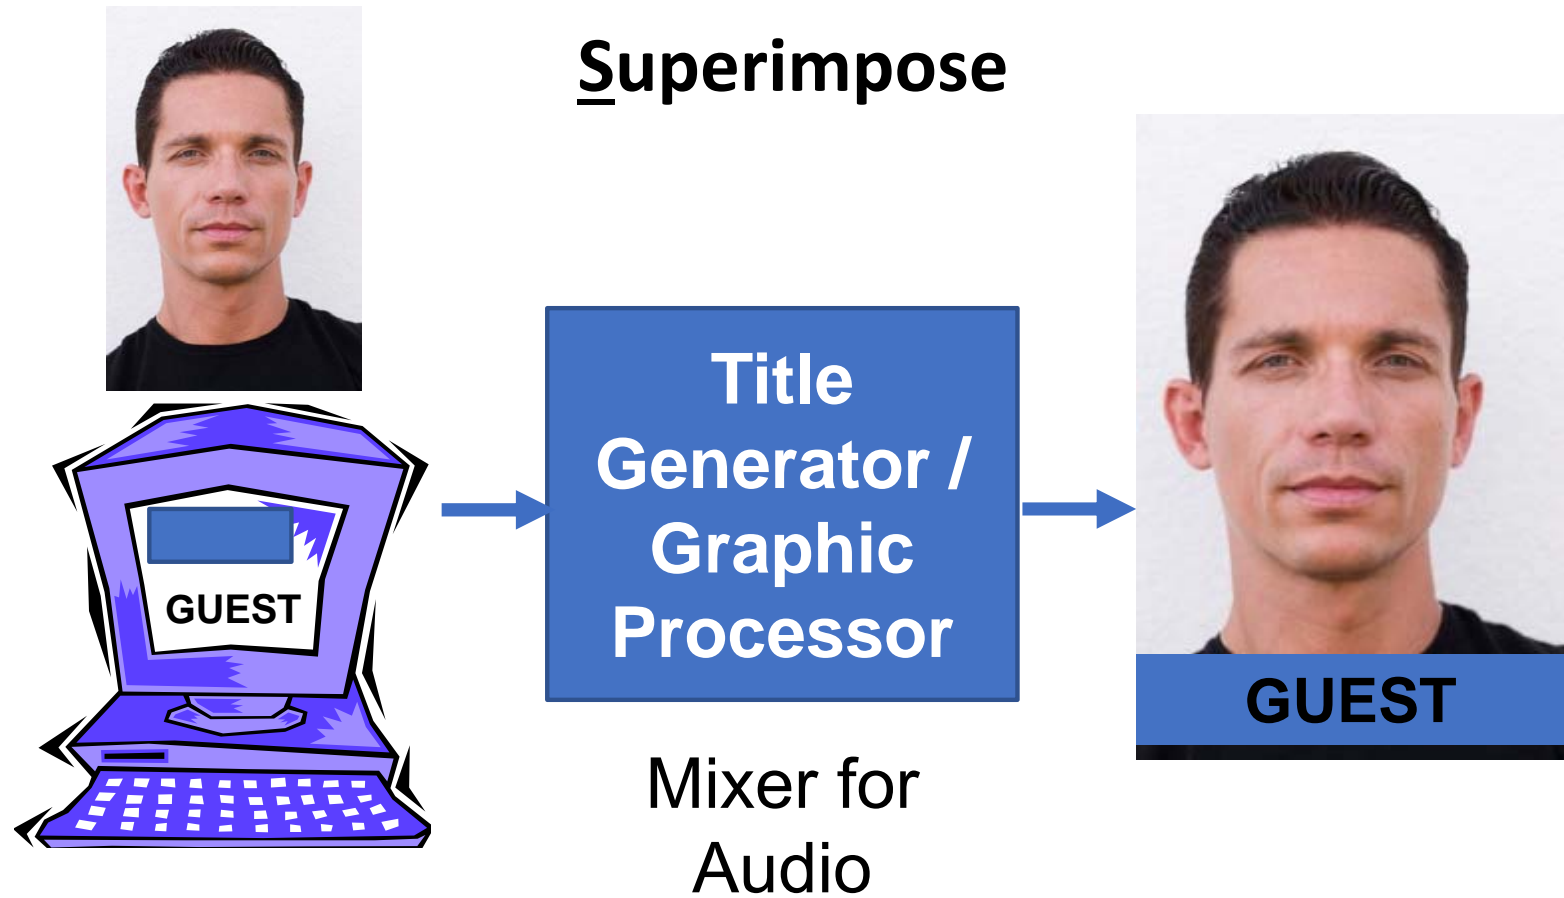

Mixer for
Audio

Matrix Switcher

Side by Side

**PIP
Processor**

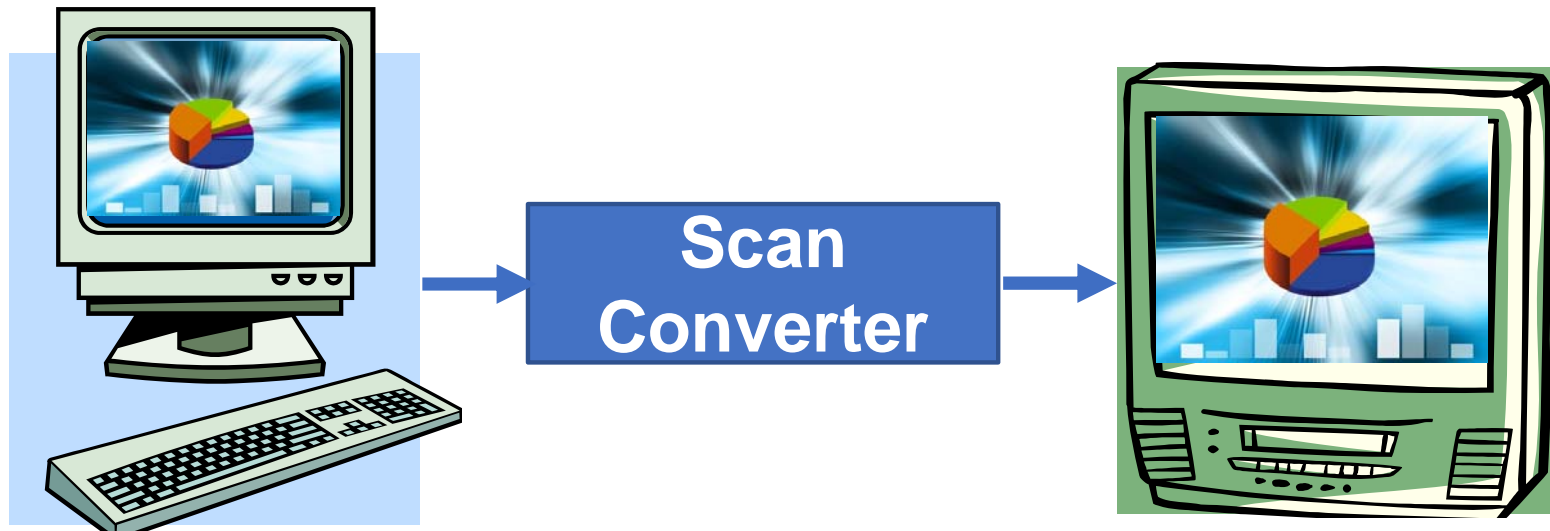

PIP = Picture in Picture

**Window Wall
Processor**

Swap

Which is a correct statement?

A.

You do not need to spend money on processing
You can split signals using cables and adapters

B.

Displays and sources will perfectly auto adjust their images
to match after getting EDID settings

C.

External processors are better than ones in displays

D.

You will need a separate box for each processing option

Audio Processing

Biamp Education Experience

Gain structure

Goal

- Maximize signal to noise ratio
- Maintain sufficient headroom for signal peaks

General procedure

- Use proper signal for calibration
- Follow the signal path– i.e. don't start at the amplifier
 - Get the signal to operating level as soon as possible
 - Maintain unity gain
 - Adjust amplifiers last
- Use meters

biamp.
subscribe
B I A M P

Audio Processing

Biamp Education Experience

Summarizing

Audio signals can be measured in RMS, Peak or Full Scale values

- RMS gives a better idea on how loud a signal is **Typically Input**
- Peak indicates where the signal is in relation to the limits of a **Typically output** sound system
- Full Scale indicates when digital saturation will occur **Analog Gain Points**

There's no rule as to which meter to use where in the signal chain...but

biamp.
subscribe
B I A M P

Meters

Scales compared

Volts	dBu	VU	dBfs (SMPTE RP155)
12.283V	24 dBu		0 dBfs

“Unity Gain”

Audio Processing

Biamp Education Experience

Gain structure

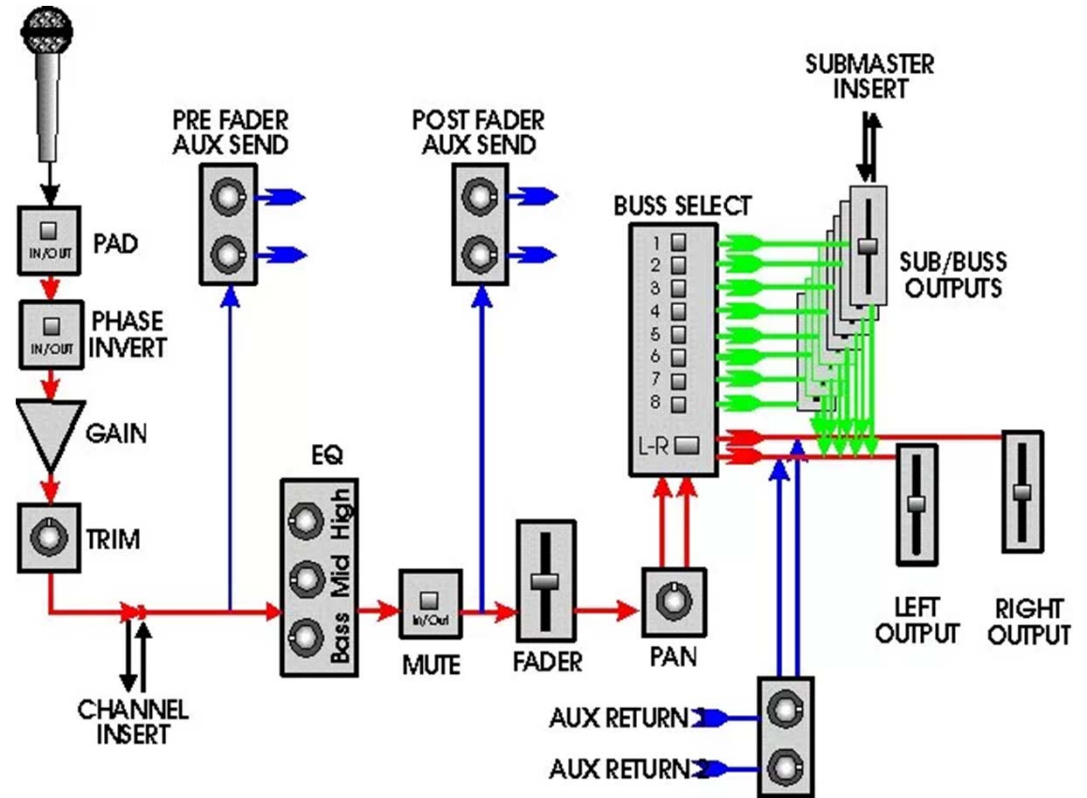

Adjust input gain for proper operating level

- Use peak meters
- Adjust gain until the peak indicator starts to flash
 - Usually 3~6dB before actual clipping
- Then reduce gain 6~12dB to provide additional headroom

Maintain unity gain throughout the signal chain

- Maintain faders and level controls at 0dB
- Compensate level where needed

biamp.
subscribe
B I A M P

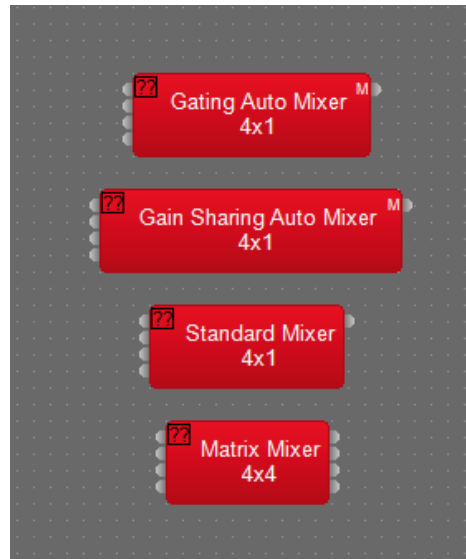

Audio Processing

- Mixer = Combines sound levels
- Equalizer = adjust frequencies (filter or enhance)
- Reverb and Delay = adjust for reflections
- Compressors & Limiters = adjust frequency range
- Gates and Expanders = eliminate low noise

Audio Processing

– Mixer = Combine sound levels

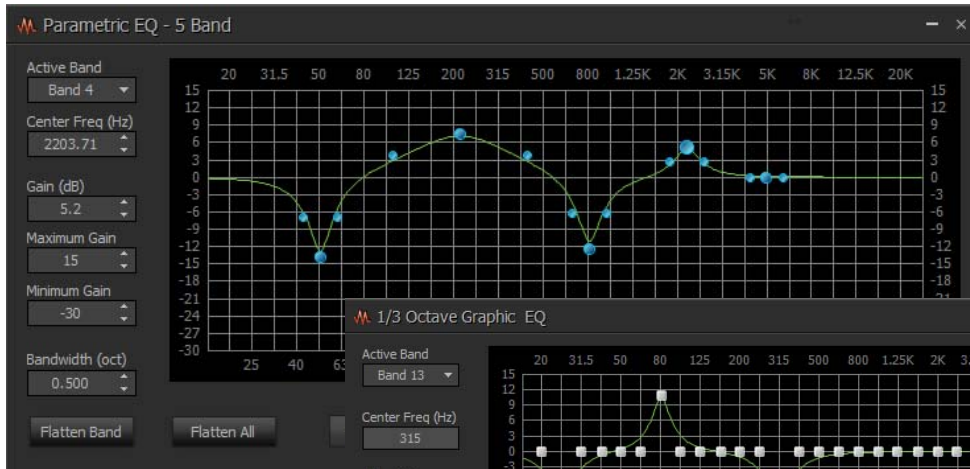

Automatic mixer suggested settings:

- ④ Threshold: -40 dB
- ④ Attenuation: -40 dB
- ④ Attack: 1.0 ms
- ④ Release: 50 ms
- ④ NOM Gain: On
- ④ Hold: 1.0 seconds
- ④ Last Mic: Last
- ④ NOM Limit: 4

Audio Processing

– EQ

- Parametric EQ - 5 Band
- 1/3 Octave Graphic EQ
- Feedback Suppressor - 5 Band

– EQ – Starting Points

Vocals

- < 200 Hz: Cut for clarity
- 150 Hz – 600 Hz: Warmth
- 500 Hz – 2 kHz: Nasal (Cut to eliminate) Around 350
- 3 kHz – 5 kHz: Sibilance (Cut to eliminate) Around 2750
- 1.5 kHz – 8 kHz: Clarity and Presence 2-4K sweet spot
- 10 kHz+: Airy (Breathy)

– EQ

First, understand that prerecorded program sources like Blu Rays, DVDs, and music CDs have been optimized as audio sources when produced

Therefore, other than gain, these sources do not need any other input processing

If these don't sound good through the system loudspeakers, look to improper equalization on the output processing strip feeding the loudspeakers

– EQ

Input source parametric equalization is only for

- Microphone
- Telephone
- CODEC optimization

Fixing its response if:

It is too thin or tinny

Has too much bass

To notch out feedback ringing in the case of local mics

Audio Processing

– Filters

Audio Processing

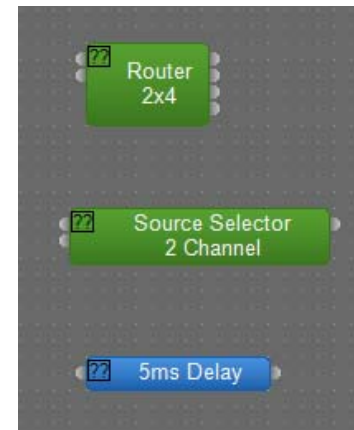

– Filters

Filters

- Use High Pass Filters on speech microphones to reduce rumble
- Use Low Pass Filters on conferencing microphones to reduce noise and reflections in problematic rooms
- Boost to 2KHz range for enhanced speech intelligibility
- User higher "Q" filters to remove unwanted resonances

Audio Processing

– Dynamics

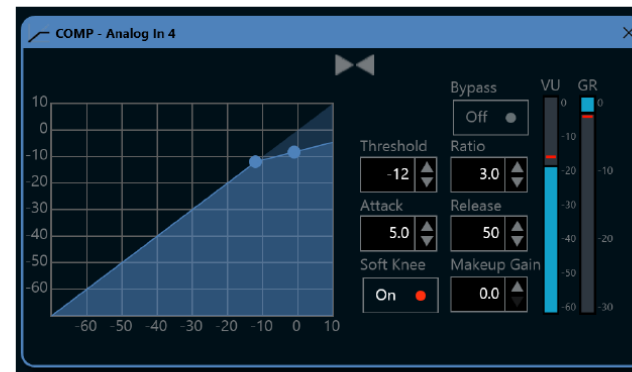

Input CoMPression (CMP):

A compressor is used to reduce the level of overly loud signal sources

Since recorded and broadcast sources are already level-limited, only microphone, telephone and CODEC conference sources can benefit from compression

A good rule of thumb for setting parameters of an Avia input compressor is:

- Threshold: -12 dB, Ratio: 3:1
- Attack: 5.0 ms, Release: 50 ms
- Soft knee: On, Makeup gain: Off

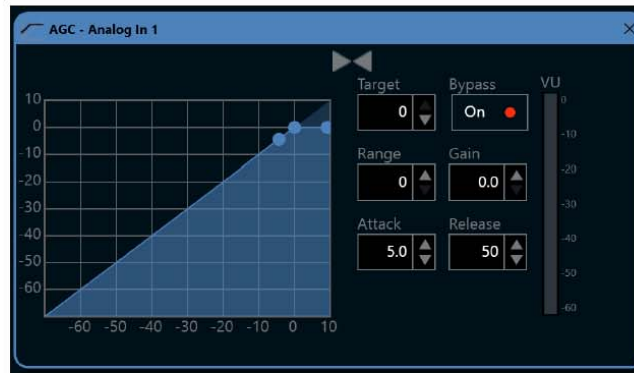

Input Automatic Gain Control (AGC):

Automatic Gain Control (AGC) is generally used in broadcasting to limit the dynamic range of a signal source whose nominal level varies too much

It is tempting to employ AGC for that soft talker who is afraid to speak loudly into their mic, and isn't loud enough in the local loudspeakers

But often feedback will occur before they are loud enough

AGC should only be used if absolutely necessary, and only on remote outputs like far-end teleconferencing telephones & CODECs or recording feeds

Output LIMiter (LIM):

To prevent excessive output levels:

- ④ Threshold: -3 dB
- ④ Ratio: 20:1
- ④ Attack: 0.1 ms
- ④ Release: 50 ms
- ④ Soft knee: ON
- ④ Makeup Gain: 0 dB

For a 14-dB crest factor (headroom):

- ④ Threshold: -10 dB
- ④ Ratio: 10:1
- ④ Attack: 0.1 ms
- ④ Release: 50 ms
- ④ Soft knee: ON
- ④ Makeup gain: +6 dB

Audio Processing

Dynamics

- Use limiters on outputs to amplifiers and recording devices to prevent overdriving
- Use compression on microphones:
 - 2:1 to 4:1 on conversational speech
 - 4:1 to 6:1 on lecture/presentation
 - 4:1 or greater on dynamic instruments
- Use gates on conferencing microphones when automixing is not used
- Use AGC on telephone and recording device feeds

Audio Processing

Automixing

- Use gated automixing for conferencing
- Use gain sharing automixing for panel discussions and recording applications

General Procedures

- Equalize using a “subtractive” process (use cut rather than boost)
- Understand the bandwidth of any content
- Know loudspeaker frequency response and power handling capabilities
- Perform delay alignments before performing equalization
- Understand the target levels for your application
- Understand how to accurately use your test equipment
- **Practice**

Audio Processing

Room Acoustics

Reflection

Absorption

Diffusion

Which is a correct statement?

A.

Start with the amplifier and work back to set levels

B.

Amplifiers can handle any level sent to them and you just attenuate the signal if it is too loud

C.

Processing can fix any audio issue and especially if you use a lot of processing options

D.

Get input to Unity Gain asap and then maintain throughout

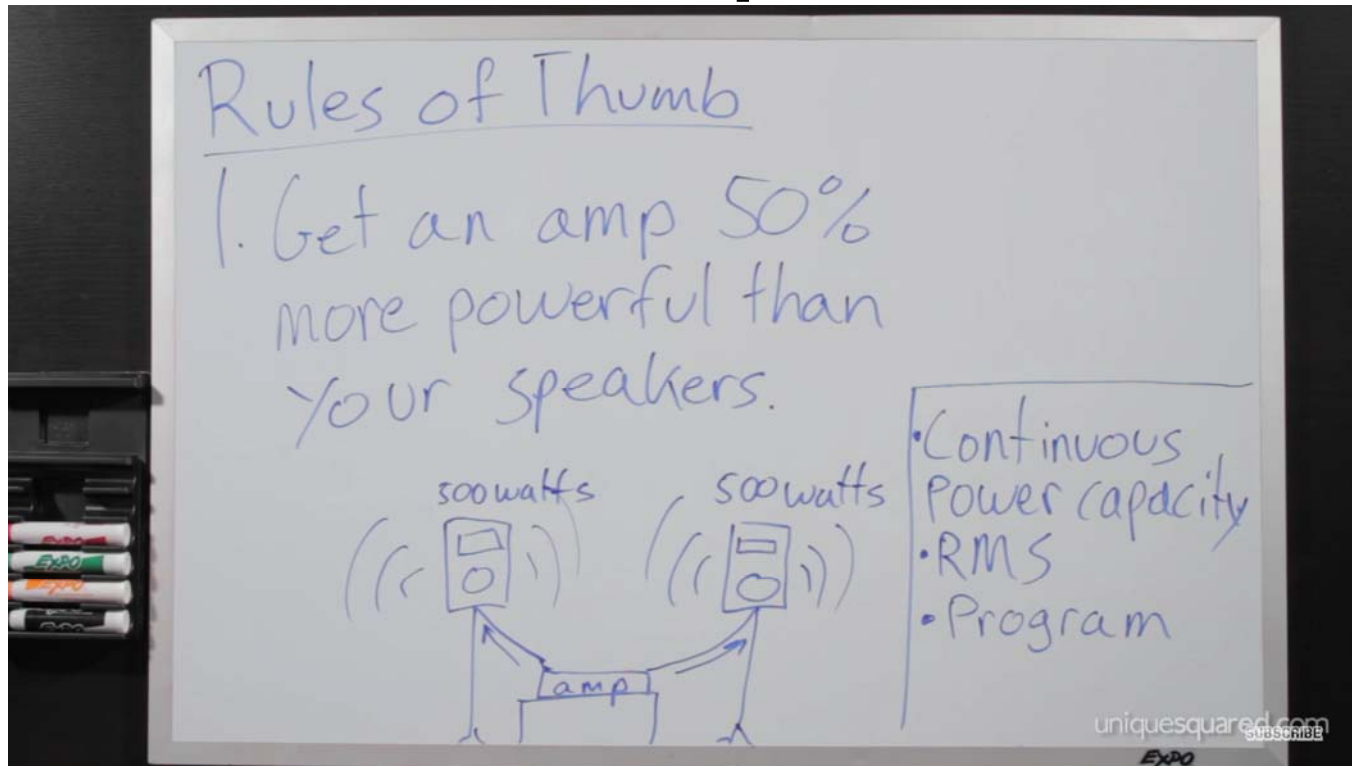

Audio Amplifiers

Audio Amplifiers

Audio Amplifiers

If all of the coils are the same impedance, it is very easy to calculate final impedance. You will take the impedance of the voice coils and divide by the number of voice coils. This formula only works if all the voice coils are the same impedance.

You have two 4 Ω speakers and an 8 Ω speaker:

$$\begin{aligned} 1/4 \Omega + 1/4 \Omega + 1/8 \Omega &= 1/R_{\text{total}} \\ .25 + .25 + .125 &= 1/R_{\text{total}} \\ .625 &= 1/R_{\text{total}} \\ &= 1.6 \Omega \end{aligned}$$

***not all the speakers will get the same power

Audio Amplifiers

When you wire voice coils in series, you will simply add the resistance of all the voice coils to know what the impedance will be at the amplifier.

The coils do not need to be the same impedance but it will affect how much power each speaker receives from the amplifier.

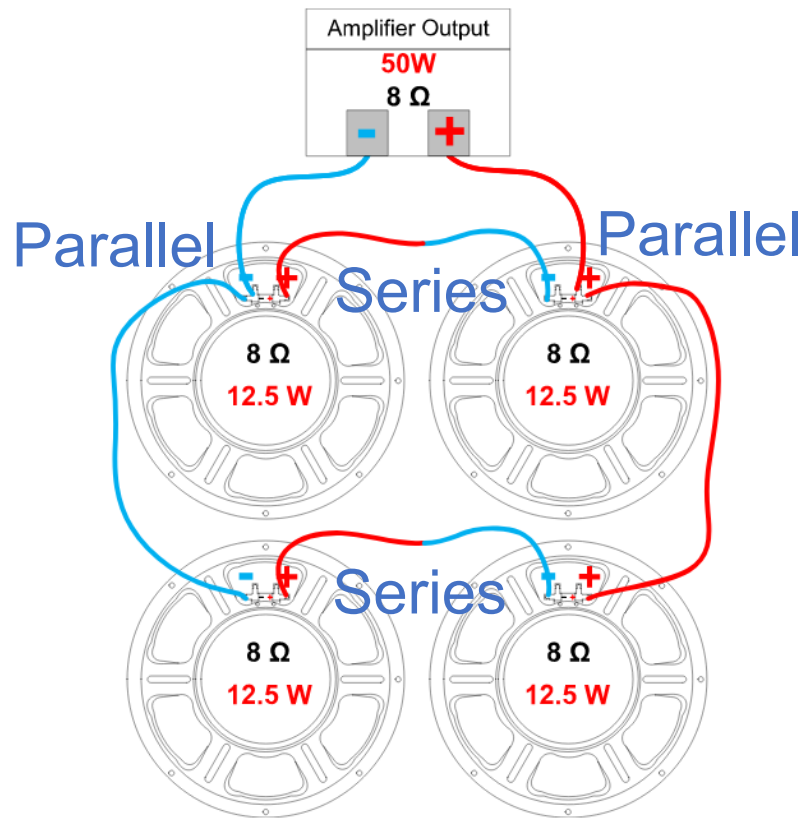

It is never recommended to mix impedances of speakers connected to the same terminals.

Daisy chain the + on speakers to the + on the amp
 Daisy chain the - on the speakers to the - on the amp

Home run a + then send the – of that speaker to the + of the next
Continue to last speaker and then home run -

Need 4 Single Coil speakers.
Should have even number of voice coils

Four single voice coil speakers

two dual voice coils speakers

If all four speakers have the same impedance, with series-parallel wiring, the final impedance will be the same as the impedance of a single speaker.

4 Single Coil 4 Ω speaker OR 2 Dual Coil 4 Ω speakers

$$4 \Omega + 4 \Omega // 4 \Omega + 4 \Omega = 4 \Omega$$

$$8 \Omega // 8 \Omega = 4 \Omega$$

250W RMS 4 ohm

100V (100 Volt Line)
30 Watts Maximum or 333Ω .

A 'Simple Audio Tips' logo is in the bottom right corner.

MID POWER AMPLIFIER

HIGH POWER AMPLIFIER

REMEMBER

THE POWER AMPLIFIER IS DEPENDENT ON THE AC POWER SOURCE TO PRODUCE THE POWER IT WAS DESIGNED TO DELIVER

Amplifier sizing:

Class D amplification is fairly efficient, so given 80% efficiency:

A single 15-amp circuit at 120 VAC delivers 1800 watts (15×120) of long-term power, so no matter what an amplifier's power rating is, the AC circuit is the limiting factor

IF THE AC SOURCE IS NOT CLEAN,

OR IF PROPER GROUNDING IS NOT IMPLEMENTED,

There is a voltage difference between the ground points on each outlet.

Visit www.alectrosystems.com to learn more about Professional Audio and Video

PARALLEL
MONO

INPUT

STEREO

PARALLEL
MONO

OUTPUT

STEREO

BRIDGED MONO

Which is NOT a correct statement?

A.

Use an amp 20-50% more than your speakers

B.

Speaker wiring and total does not change resistance

C.

A standard meter can be used to check a lot in audio but to measure resistance you should use an impedance meter

D.

You have to pay attention to settings and power for amplifiers to ensure best audio

Sound Pressure Level –SPL:

Loudspeaker Sensitivity: dB
 SPL 1 watt @ 1 meter

Power: +3dB for every 2x watts

Distance: -6dB for every 2x distance

- 0dB faintest audible sound
- 50-60dB normal conversation
- 120dB painful

96 dB SPL @ loudspeaker 1W/1M
 + 24 dB (250 W) [8 x 3dB] Amplifier Gain
 -30 dB (32 M) [5 x -6dB] Distance Loss

90 dB SPL at the listener

Doubling

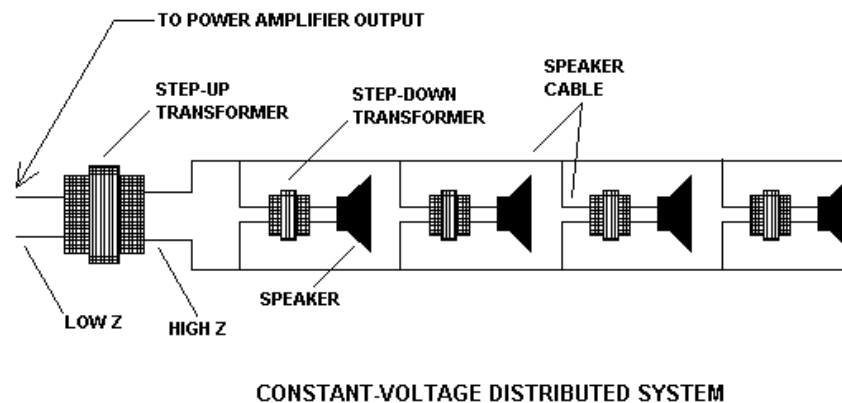

- 1
- 2
- 4
- 8
- 16
- 32
- 64
- 128
- 256

To make the system appreciably louder, the amplifier should be replaced with an amplifier 4 to 10 times more powerful

- 4X the power = 6 dB louder, which is perceptively louder in volume
- 10X the power = 10 dB louder, which is perceptively twice as loud
- Be sure that the existing loudspeakers can handle the additional power

Crestron – “If you are without a 70-volt amplifier, but need to drive a 70-volt loudspeaker line, a low-impedance amplifier channel rated for 600 watts @ 8 ohms supplies a 69-volt line, for a 100-volt line, 1250 watts @ 8 ohms”

PAG/NAG (Potential Acoustic Gain/Needed Acoustic Gain):

Definitions:

- **D0** Talker-to-farthest-listener distance
- **D1** Mic-to-closest-loudspeaker distance
- **D2** Listener-to-closest-loudspeaker distance
- **DS** Talker-to-mic distance
- **EAD** Equivalent Acoustic Distance, the desired virtual distance between the talker and furthest listener
- **NOM** Number of Open Microphones, always set to 1 when using automatic mixer function
- **FSM** Feedback Stability Margin

Potential Acoustical Gain:

P.A.G. = Potential Acoustic Gain

$$\text{P.A.G.} = 20 \log_{10} \left[\frac{D_1}{D_s} \times \frac{D_0}{D_2} \right] \text{ in decibels}$$

PAG/NAG (Potential Acoustic Gain/Needed Acoustic Gain):

NAG formula:

- $NAG = 20\text{Log}(D_0/EAD)$

For example (imperial):

- $NAG = 20\text{Log}(50 \text{ ft.}/8 \text{ ft.})$
- $NAG = 20\text{Log}(6.25)$
- $NAG = 15.9 \text{ dB}$

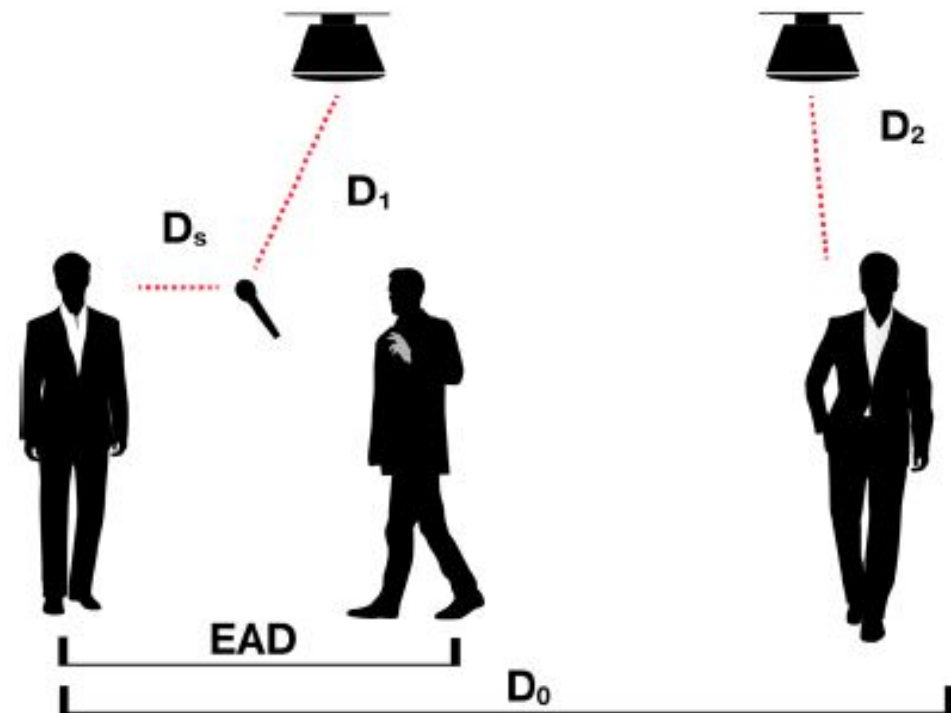

PAG/NAG (Potential Acoustic Gain/Needed Acoustic Gain):

PAG = 22.5 dB [22.4 dB]

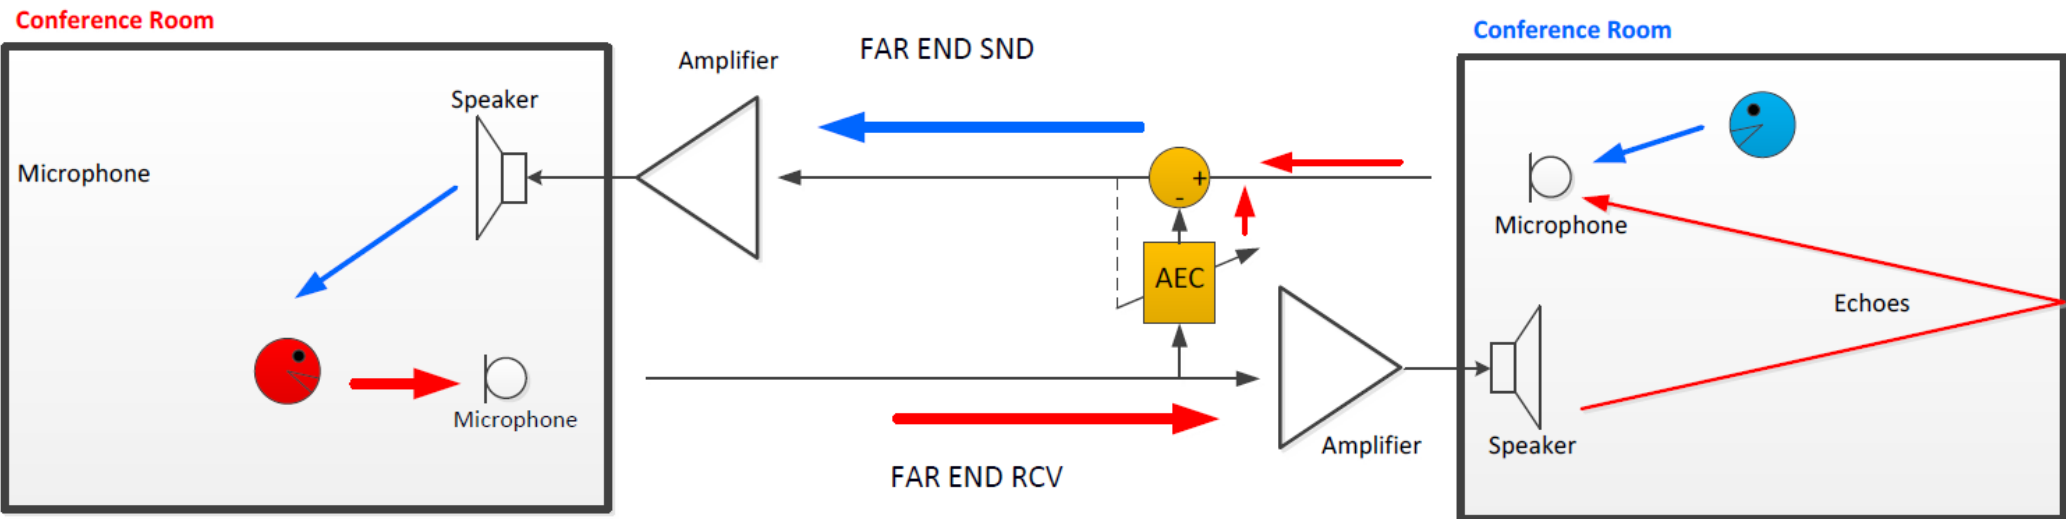

NAG = 15.9 dB [15.6 dB]

PAG > NAG

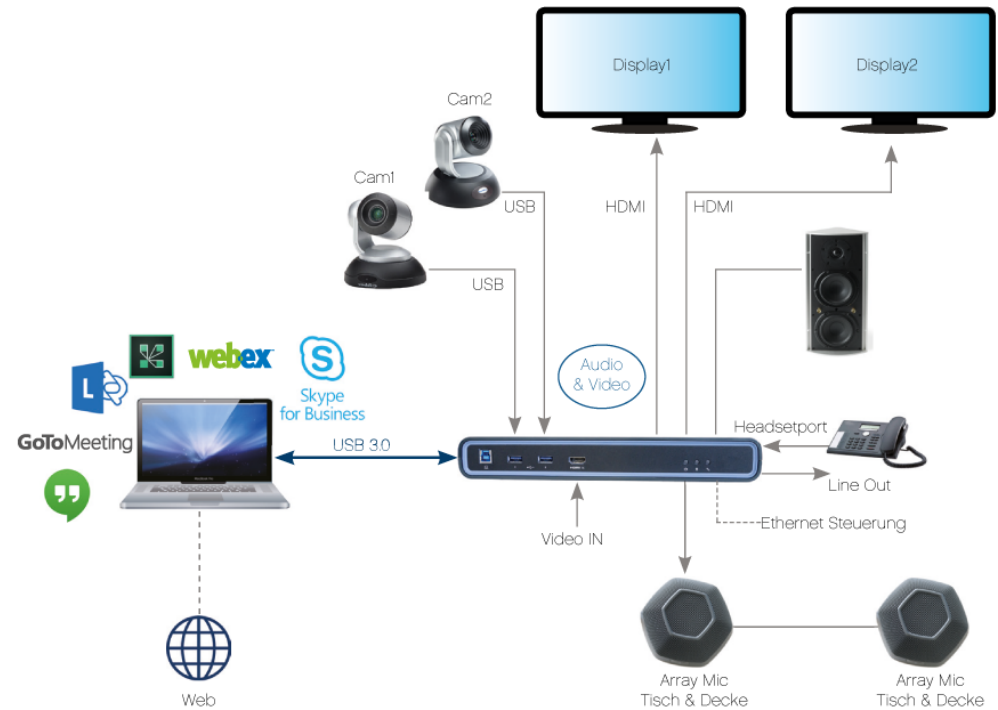

The system parameters will provide enough gain-before-feedback to acoustically locate all listeners within 8 ft. [2.5 m] of the talker

AEC

Which is NOT a correct statement?

A.

You will have to do a lot of math to get best audio

B.

If a person on the far end is hearing themselves in a conference call it is a problem on your side with AEC

C.

Feedback issues are due to frequency and distances

D.

The most secured and easiest method of video conferencing is still with a codec and not soft conferencing

Step 5 – Control

Touch Panels

Keypad

User Interfaces

Control Processor

- Control processor with touch panel/software app
- Button panel
- Browser control
- Control anything with
 - Serial
 - IR
 - Ethernet
 - Relay /Contact Closure

Infrared Emitter

Screen Interface

RS232 Cable

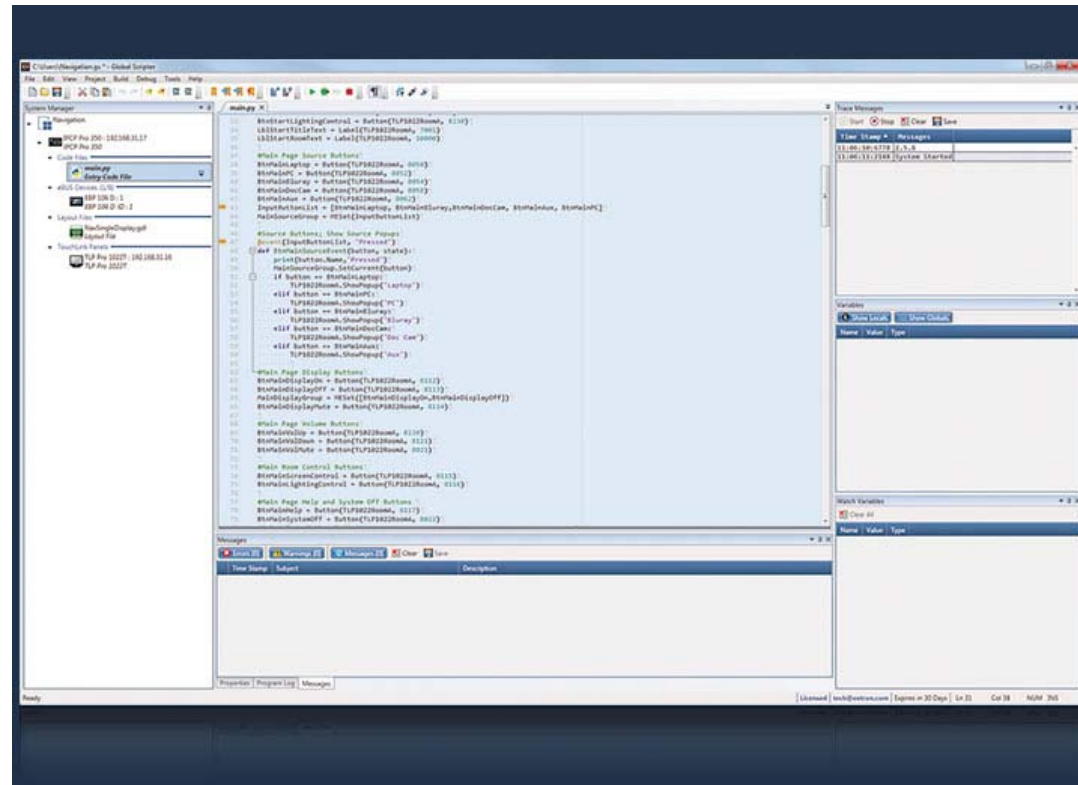

Cresnet Wiring

Projector Lift

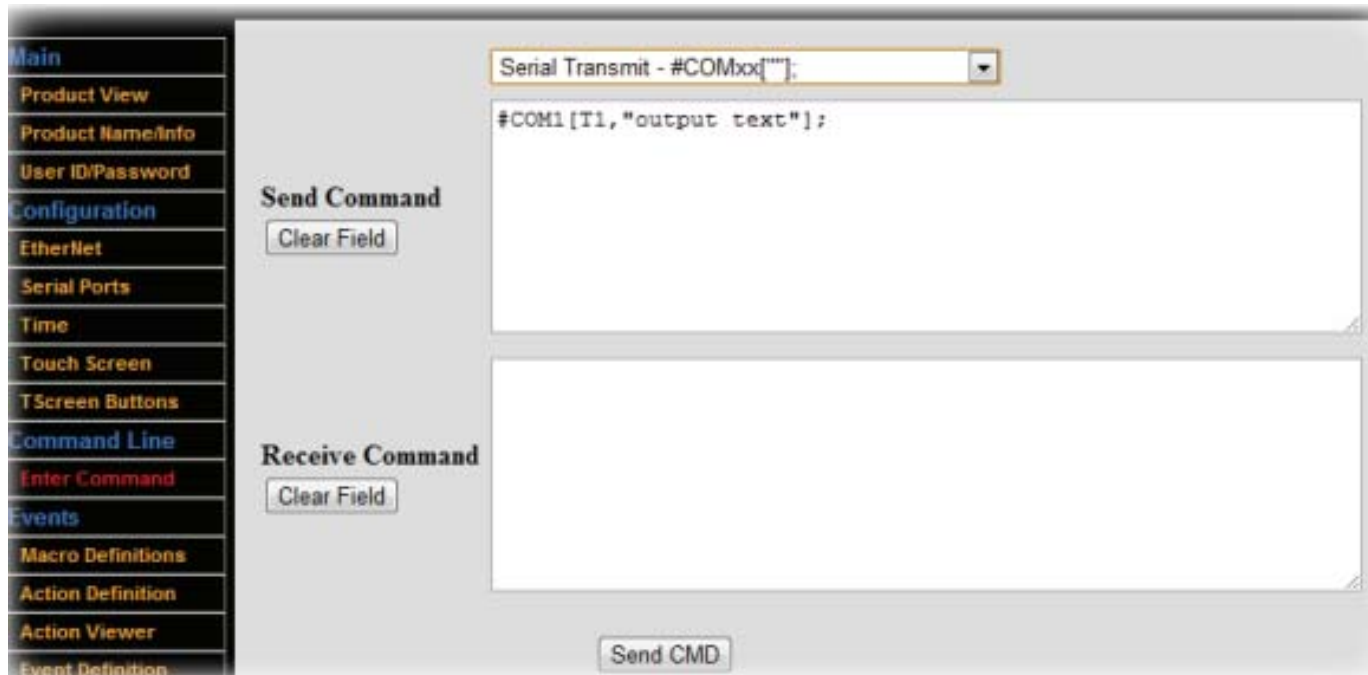

Programmable Systems

Configurable Systems

Conprogable Systems

Which is NOT a correct statement?

A.

You have to have years of training to be a good programmer

B.

As long as a device has Ethernet, Serial, IR, Contact, or Relay control capabilities we can control it with AV system

C.

The type of user interface for controls depends on inputs and outputs and user perception to simplicity

Let's Put into Practice

Let's Put into Practice

What you do, ask, and look for in a job walk/review?

- ❖ Determine sources & outputs – “Uses of system”
 - ❖ Determine locations, distances, pathways
 - ❖ What's existing – likes and dislikes
 - ❖ Customer Expectations
- ❖ Determine existing network and required additions
 - ❖ Who are the contacts and roles
 - ❖ Expected timelines

Let's Put into Practice

What tools do you need on a job walk?

- ❖ Camera
- ❖ Digital Notepad
- ❖ Distance Meter
- ❖ Stud finder
- ❖ Ladder & Tools for access
- ❖ Keys

Let's Put into Practice

Scenario 1

Customer wants a VHS with composite output, Blu Ray with HDMI output, Rack PC with Display Port Output, and Laptop

Show on a TV in a room that seats about 6 people

Does not want multiple remote controls
